Edmonton Symptom Assessment System Revised (ESAS-r) Guidelines

Purpose

The ESAS is a tool that was developed to assist in the initial assessment of nine symptoms that are common in palliative care patients: pain, tiredness, drowsiness, nausea, lack of appetite, depression, anxiety, shortness of breath, and wellbeing (1). There is also a blank scale for patient-specific symptoms. The ESAS has been revised to improve ease of understanding and completion for patients (2). The revised version of the tool is known as the ESAS-r. Changes include specifying a timeframe of “now”, adding definitions for potentially confusing symptoms, modifying the order of symptoms, adding an example for “other symptom”, and altering the format for improved readability.

The ESAS-r is intended to capture the patient’s perspective on symptoms. However, in some situations it may be necessary to obtain a caregiver’s perspective. The ESAS-r provides a profile of symptom severity at a point in time. Repeated assessments may help to track changes in symptom severity over time. The ESAS-r is only one part of a holistic clinical assessment. It is not a complete symptom assessment in itself. It is strongly recommended for any symptoms scoring 5 or greater to be further assessed in depth using the Symptom Assessment Acronym OPQRSTUV assessment tool.

General Information

How to do the ESAS-r

It is recommended that the patient complete the ESAS-r with guidance from a health care professional, especially on the first occasion.

The patient should be instructed to rate the severity of each symptom on a 0 to 10 scale, where 0 represents absence of the symptom and 10 represents the worst possible severity. The number should be circled on the scale.

The patient should be instructed to rate each symptom according to how he or she feels now. The health care professional may choose to ask additional questions about the severity of symptoms at other time points e.g. symptom severity at best and at worst over the past 24 hours.

Definitions have been added to items that have been found to be more problematic for patients to understand or rate (3); it is recommended to review these with the patient:

- Tiredness - lack of energy
- Drowsiness - feeling sleepy
- Depression - feeling sad
- Anxiety - feeling nervous
- Wellbeing - how you feel overall

With the previous version of the ESAS, patients often reversed the scale for appetite i.e. they considered “0” as “no appetite” and “10” as “best appetite”. The scale has now been re-labeled as “lack of appetite”. Coaching patients on the correct direction of the scale is still recommended.

The body diagram on the reverse side of the ESAS-r can be used to indicate sites of pain. The circled numbers can be transcribed onto the ESAS-r graph.

When to do the ESAS-r
In palliative home care, it is a good practice to complete and graph the ESAS-r during each telephone or personal contact. If symptoms are in good control, and there are no predominant psychosocial issues, then the ESAS-r can be completed weekly for patients in the home. In hospice and tertiary palliative care units, the ESAS-r should be completed daily. In other settings, palliative care consultants will utilize this tool upon initial assessment and at each follow-up visit.

Who should do the ESAS-r
It is preferable for the patient to provide ratings of symptom severity by himself/herself. If the patient cannot independently provide ratings of symptom severity but can still provide input (e.g. when the patient is mildly cognitively impaired), then the ESAS-r is completed with the assistance of a caregiver (a family member, friend, or health professional closely involved in the patient’s care). If the patient cannot participate in the symptom assessment at all, or refuses to do so, the ESAS-r is completed by the caregiver alone. The caregiver assesses the remaining symptoms as objectively as possible. The following are examples of objective indicators:

Pain – grimacing, guarding against painful maneuvers
Tiredness – increased amount of time spent resting
Drowsiness – decreased level of alertness
Nausea – retching or vomiting
Appetite – quantity of food intake
Shortness of breath – increased respiratory rate or effort that appears to be causing distress to the patient
Depression – tearfulness, flat affect, withdrawal from social interactions, irritability, decreased concentration and/or memory, disturbed sleep pattern
Anxiety – agitation, flushing, restlessness, sweating, increased heart rate (intermittent), shortness of breath
Wellbeing – how the patient appears overall

If it is not possible to rate a symptom, the caregiver may indicate “U” for “Unable to assess” on the ESAS-r and ESAS-r Graph.

The method of completion of the ESAS-r must be indicated in the space provided at the bottom of the ESAS-r and the ESAS-r Graph as follows:

Top of ESAS-r Numerical Scale
Completed by (check one):
☑ Patient
☑ Family caregiver
☑ Health care professional
☑ Caregiver-assisted
Edmonton Symptom Assessment System Revised (ESAS-r) Guidelines

Bottom of ESAS-r Graph
Insert letter from key in date column (date indicated at the top of form)
Completed by ☐☐☐☐☐☐☐
Key:
P = Patient
F = Family caregiver
H = Health care professional
A = Caregiver-assisted
U = Unable to assess

Where to document the ESAS-r
The ESAS-r is always done on the ESAS-r numerical scale and the results later transferred to the ESAS-r Graph. Graphing symptom severity directly onto the ESAS-r Graph without the use of the numerical scale is not a valid use of the ESAS-r, nor a reliable method of symptom assessment (attention to the graphed historical trend may affect the current scores and thus undermine one of the main purposes of the ESAS-r, i.e. to assess the current symptom profile as accurately as possible). The ESAS-r can be laminated and the patient uses a wipeable felt marker to document each time, then the results are transferred to the ESAS-r graph.

Other information about the ESAS-r
The ESAS-r Graph contains space to add the patient’s Folstein Mini-Mental State Examination score. The “normal” box refers to the cut-off for a normal score for the patient, based on age and education level (see Instructions for MMSE). A space for the Palliative Performance Scale (PPS) is also provided.
The ESAS-r is available in other languages, although most translations have not been validated (4).

Taking Action Using ESAS-r data
For symptoms that ESAS-r score 3 or less (considered stable), continue with usual symptom management and nursing care as per patient orders.
For symptoms that ESAS-r scores 4-6, further assessment recommended using Symptom Assessment Acronym OPQRSTUV assessment tool. May require consultation with physician and other palliative team members. Goal is to stabilize symptom to ESAS-r score 3 or less within 4 hours.
For symptoms that ESAS-r score 7 or greater, this is an unstable symptom and requires urgent attention. Further assessment recommended using Symptom Assessment Acronym OPQRSTUV assessment tool is required. Consultation with physician and other palliative team members required. Goal is to stabilize symptom to an ESAS-r score of 5 or less within 4-6 hours, and to stabilize symptom to an ESAS-r score of 3 or less within 12 hours.
